Systematic Generalization, what does this mean?

- Algorithms (fully systematic)
- Classification
 - Categorization (can be formal or "fuzzy": prototypes, etc)
 - Inheritance, is-a relationships
- Analogies
 - X (in some context) can be viewed as ...
 - X (in some sense) behaves similarly to ...

Proving a theorem requires algorithmic and categorical reasoning. Theorizing (inventing/discovering a new theorem or theory) often involves analogical thinking. Natural language makes extensive use of all of the above.

	Definition
(a) Systematicity	Recombine constituents that have not been seen together during training
(b) Productivity	Test sequences longer than ones seen during training
(c) Substitutivity	Meaning unchanged if a constituent is replaced with something equivalent
(d) Localism	The meaning of local parts are unchanged by the global context
(e) Overgeneralization	Can handle exceptions to rules and patterns?

You are hungry! Let's cook a delicious meal. Check the cookbook in the kitchen
for the recipe. Once done, enjoy your meal!

-= Backyard -=
You find yourself in a backyard.

You make out a patio table. But the thing is empty. You see a patio chair. Wow,
isn't TextWorld just the best? The patio chair is stylish. But there isn't a
thing on it. You see a gleam over in a corner, where you can see a BBQ.

There is a closed screen door leading south. There is a closed wooden door
leading west. There is an exit to the east. Don't worry, there is no door.

How can we build and train models that learn to act in ways that **generalize** to previously unseen environments or situations?

And that display **compositional systematicity**, e.g. by being able to reuse sub-skills in new combinations when appropriate?

Figure 7: The proposed algorithmic reasoning blueprint. First, an algorithmic reasoner is trained in the encode-process-decode fashion, learning a function $g(P(f(\bar{x}))) \approx A(\bar{x})$, for a target combinatorial algorithm A ; in this case, A is breadth-first search. Once trained, the processor network P is frozen and stitched into a pipeline over natural inputs—with new encoder and decoder \tilde{f} and \tilde{g} . This provides an end-to-end differentiable function that has no explicit information loss, while retaining alignment with BFS.

Sutton's "bitter lesson from 70 years of AI research"¹

Given exponentially increasing computing resources, general purpose learning and search methods end up, over a time span only slightly longer than a typical research project, outperforming knowledge-intensive, hand-crafted approaches.²

But the scale of many current SoA models is now beyond the reach of most academic researchers. So what can we do?

¹ <http://www.incompleteideas.net/IncIdeas/BitterLesson.html>

² See this blog for counterpoint re successful algorithmic methods based on human understanding

Using ideas from Veličković & Blundell - 2021 - **Neural algorithmic reasoning** [15, 16]

- Modular neuro-algorithmic software
- Mimicking the general structure of TW Oracle
- Demonstrate:
 - 1 Systematic and productive generalization
(by reliably solving TextWorld tasks)
 - 2 Transfer-adaptation:
(by learning to interpret 'noisy' raw textual observations by training outer model with neuro-algorithmic core trained using 'clean' ground-truth or semantic observations)
 - 3 Generalization from TextWorld to MiniGrid
(by adapting or retraining a subset of sub-modules)
