- Software Engineer @ EDI
(1/2 time: nominally 20hrs/week ; 3 days / week)
project: AIMS5.0
- Senior Specialist ("Vecākais eksperts") @ LU
project: Language Technologies Initiative
<https://digital-strategy.ec.europa.eu/lv/policies/language-technologies>
- Laboratory for Perceptual and Cognitive Systems @ DF
(LU DF Uztveres un kognitīvo sistēmu laboratorija)
<https://www.lpcs.lu.lv/>

Artificial Intelligence in Manufacturing leading to Sustainability and Industry5.0

All in all, the 20 **AIMS5.0** UCs highlight the project's interdisciplinary nature, as they span across 9 industrial domains (including 2 cross-domain UCs) and are covered within 2 different WPs, as shown in Figure 15.

Use case	Lead	WP	Task	Domains	Title	TRL Start	TRL end
1	AIDI	5	T5.1	Manufacturing	Development of Green AI-Lifecycle Management Approaches	4	7
2	PCL	5	T5.1	Consumer Electronics	AI Enhanced Value Chain	5	7
3	HQ	5	T5.1	Cross Domain	Servitization and service delivery enabled by Zero administration	5	7

Optimizācija

Transcripts

[Download SubRip \(.srt\) file](#)

Optimizācijas procesa laikā registrējot zudumu funkcijas vērtības grafikā, tas tiks līdzīgs šim.

Bet dažreiz optimizācija ar noklusētajiem parametriem neizdosies, un zudumu funkcijas grafiks nedils, kā gaidīts. Šajā gadījumā ir viens universāls padoms: samazināt mācīšanās ātrumu.

Mācīšanās ātrums ir līdzīgs braukšanas ātrumam, savukārt optimizācija pati par sevi ir līdzīga automašīnas vadīšanai no zudumu funkcijas kalna līdz zemākajam punktam, mūsu gadījumā okeānam.

Lai arī "Backpropagation" algoritms AdamW iekšienē veic optimālu stūresānu izmantojot stāvāko gradienta lejupslīdes virzienu,

nav izgudrota metode kā automātiski noteikt drošu mācīšanās ātrumu. Pārāk liels ātrums izraisīs avāriju optimizācijas procesā, bet pārāk zems mācīšanās ātrums optimizācijas procesu padarīs ļoti

TAMP

Recap

Conclusion

xtra slides

- Thesis topic (title as originally proposed):
Tracking the state of the world [with Deep Learning models]

- **Generalizable Systematic Problem Solving**

- Autonomous agents - goal attainment with a variety of goals and environment configurations
- Skills learned from experience - e.g. by interacting with simulated environments
- Ideally: predictable, explainable and easily adjustable behavior
- (**new**): applied to robotics use cases
- -> Learning Generalized Policies (w/ hybrid neuro-symbolic methods?)

- **Need to Publish (still...)**

Learning Generalized Policies

Adaptive, Systematically Compositional Sequential Decision Making

Introduction

Interests and goals

About last year

Transformers for RL

Code gen

LLMs

Sim envs

TAMP

Recap

Conclusion

xtra slides

- **Adaptive** (partially observable and dynamic world)

- **Systematically Compositional**

- Intelligently recombine from a repertoire of skills

- **Sequential Decision Making**

- Perceive: sensory signals -> beliefs about state of the world
 - Think / plan (if required & time allows) ; choose an action
 - Act: attempt the intended action
 - Observe: see what happens
 - Adjust: react / re-plan accordingly
 - (maybe also learn something about the environment or the task)

■ 1st idea

- Tooling for experimenting with generalized policy learning for TextWorld
- ... together with some initial results demonstrating usefulness
- (Nice to Have) also integrate Minigrid

■ 2nd idea

- (Not very well defined at the time of my presentation last year)
Eventually became:
 - Assess performance of pretrained LLMs on original ('obfuscated') vs. straightforward ('LLM friendly') output from TextWorld games
 - Compare performance of finetuned LLMs vs. baseline Transformer and RL models trained using simplified ('Transformer friendly') or fully abstract ('logic-programming friendly') observations
 - Compare performance of new Transformer variants specialized for sequential decision making

You are hungry! Let's cook a delicious meal. Check the cookbook in the kitchen
for the recipe. Once done, enjoy your meal!

-= Backyard -=
You find yourself in a backyard.

You make out a patio table. But the thing is empty. You see a patio chair. Wow,
isn't TextWorld just the best? The patio chair is stylish. But there isn't a
thing on it. You see a gleam over in a corner, where you can see a BBQ.

There is a closed screen door leading south. There is a closed wooden door
leading west. There is an exit to the east. Don't worry, there is no door.

TAMP

Recap

Conclusion

xtra slides

- Partial visibility - Player can see only what's in current room, only in opened containers
- Large and fairly complex action space
- Objects can be ON or IN other objects, or carried (= IN Inventory)
- Object state attributes based on object type:
 - open / closed / locked
 - cut / chopped / sliced / diced
 - roasted / baked / fried / ...
- Hierarchical type system supports multi-inheritance
- Limited inventory capacity (requires planning)
- Verb + direct object + instrument
 - **peel the purple potato with the knife** → **a peeled purple potato**
- Complex NL expressions: ***the sliced roasted yellow Idaho potato***

The 39th International Conference on Logic Programming

<https://iclp2023.imperial.ac.uk/program>

Imperial College London, UK, July 9 - 15, 2023

- Registered abstracts for 2 potential submissions
 - 1) toolbox idea -> a paper for the Doctoral Consortium
 - 2) the 2nd project -> a short paper for the main conference
- Intense work on first one, then the other, from Jan 31 - April 27
But, in the end, didn't actually submit either one
- Lessons learned:
 - it takes a lot of work to prepare a decent paper
 - prematurely submitting a placeholder abstract is not a good idea

Learning Generalized Policies via code generation

Introduction

Interests and goals

About last year

Transformers for RL

Code gen

LLMs

Sim envs

TAMP

Recap

Conclusion

xtra slides

■ (Hoped for) benefits:

- More systematic generalization to unseen / OOD env variations
- Learning new tasks from a small number of examples
- Inspectability / verifiability

■ Methods for code gen or program induction

- Dataset of input : output examples -> program
- Oracle or Learned Black-box policy -> examples, traces -> code
- Rule set or State machine or Logic Program induction (Inductive Logic Programming)
- Abstracting / generalizing from specific -> more general
- From a collection of narrowly specific programs -> library of subroutines / API
- LLM to directly generate code from task descriptions
- LLM to generate policy sketches -> code skeleton

The rise of the LLMs

- About last year
- Transformers for RL
- Code gen
- LLMs
- Sim envs
- TAMP
- Recap
- Conclusion**
- xtra slides

- Generalized policy for TextWorld games via LLM -> code gen
 - RQ? Can LLM code gen produce a program that generalizes better than:
 - 1) LLMs used directly for planning/action selection
 - 2) RL or Transformer-RL baseline models
- TAMP ; hybrid neuro-symbolic, hierarchical planning

Questions/Discussion...

`guntis_vilnis.strazds@lu.lv`

A decorative geometric pattern in the bottom right corner, consisting of a grid of triangles in various shades of blue, creating a pixelated or mosaic-like effect.

Interactive Text Games = Natural Language-based observations and actions:

- **Observations** – textual descriptions of what the player can currently see
- **Actions** – player specifies what to do next via natural language commands
- **State representation** – LLMs can facilitate encoding history of observations to a representation of the current state of the world
- **Common-sense knowledge** is helpful – which items (based on their names) can be picked up and carried, opened, sliced and diced, cooked?
- LLM as **World model** – predict effects of potential actions given current world state

Disentangling Parsing vs Planning & Reasoning

- Introduction
- Interests and goals
- About last year
- Transformers for RL
- Code gen
- LLMs
- Sim envs
- TAMP
- Recap
- Conclusion
- xtra slides**

TextWorld - challenging for ML (easy for humans):

- Understanding/tracking state of the world from NL descriptions
- Incomplete initial information about the world (not fully observable)
- Reasoning/Learning about effects of actions given current world state
- Planning / acting systematically (long-range) to achieve dynamically specified goals

Research questions:

Which of the above are most problematic (for baseline RL, Imitation Learning, for LLMs)? How systematic are LLMs w/respect to planning? Can non-huge models be directly trained to do more systematic planning? Future: might similar methods be applied to improve the systematicity of mega-scale models like LLMs for reasoning and planning?

Abstracting away from natural language

- 1) Original, intentionally somewhat obfuscated NL descriptions
- 2) Straightforward Natural Language descriptions ("LLM friendly")
- 3) Simplified, schematic textual descriptions ("Transformer friendly")
- 4) Maximally abstract observations ("Logic-programming friendly")

(With decreasing complexity of NLP parsing, total vocabulary size also decreases, as well as the number of potential actions the model needs to consider.)

■ Original:

-= Kitchen -= You've entered a kitchen.

You can make out an opened fridge nearby. The fridge is empty! What a waste of a day! You can see an open conventional looking oven in the room. What a letdown! The oven is empty! You can make out a table. The table is massive. On the table you can see a cookbook. Oh, great. Here's a counter. Unfortunately, there isn't a thing on it. You scan the room, seeing a stove. But there isn't a thing on it. Aw, and here you were, all excited for there to be things on it!

There is a closed wrought iron door leading south. There is an exit to the east. Don't worry, there is no door. You don't like doors? Why not try going west, that entranceway is not blocked by one.

■ Transformer friendly:

```
-= kitchen =- IN +open c_ fridge : nothing ; IN +open oven_ oven :  
nothing ; ON s_ table : o_ cookbook ; ON s_ counter : nothing ; ON  
stove_ stove : nothing ;  
Exits : south +closed wrought iron door to unknown , east to unknown ,  
west to corridor ;
```

■ Logic-programming:

```
at( player, r_0, 6). at( fridge_0, r_0, 6). at( oven_0, r_0, 6). at( s_1, r_0,  
6). at( s_2, r_0, 6). open( fridge_0, 6). open( oven_0, 6). on( o_0, s_1,  
6). instance_of( o_0, o ). instance_of( s_0, s ). [...] link( r_0, d_0,  
unknownS). closed( d_0, 6). south_of( unknownS, r_0), west_of( r_1,  
r_0). east_of( unknownE, r_0).
```

Looks a lot like Prolog; based on different formal semantics

Language constructs

- Facts `q(42).`
- Rules `p(X) :- q(X), not r(X).`
- Conditional literals `p :- q(X) : r(X).`
- Disjunction `p(X) ; q(X) :- r(X).`
- Integrity constraints `:- q(X), p(X).`
- Choice `2 { p(X,Y) : q(X) } 7 :- r(Y).`
- Aggregates `s(Y) :- r(Y), 2 #sum{ X : p(X,Y), q(X) } 7.`
- Multi-objective optimization `:~ q(X), p(X,C). [C042]`
`#minimize { C042 : q(X), p(X,C) }`

¹In: Garcia de la Banda, M., Pontelli, E. (eds) Logic Programming. ICLP 2008. Lecture Notes in Computer Science, vol 5366. Springer, Berlin, Heidelberg.

Stable models

- A set X of atoms satisfies a propositional theory Φ , written $X \models \Phi$, if $X \models \phi$ for each $\phi \in \Phi$
- The set of all \subseteq -minimal sets of atoms satisfying a propositional theory Φ is denoted by $\min_{\subseteq}(\Phi)$
- A set X of atoms is a **stable model** of a propositional theory Φ , if $X \in \min_{\subseteq}(\Phi^X)$
- If X is a stable model of Φ , then
 - $X \models \Phi$ and
 - $\min_{\subseteq}(\Phi^X) = \{X\}$
- Note In general, this does not imply $X \in \min_{\subseteq}(\Phi)$!
- The **reduct**, ϕ^X , of a formula ϕ relative to a set X of atoms is defined recursively as follows:
 - $\phi^X = \perp$ if $X \not\models \phi$
 - $\phi^X = \phi$ if $\phi \in X$
 - $\phi^X = (\psi^X \circ \varphi^X)$ if $X \models \phi$ and $\phi = (\psi \circ \varphi)$ for $\circ \in \{\wedge, \vee, \rightarrow\}$
 - If $\phi = \neg\psi = (\psi \rightarrow \perp)$, then $\phi^X = (\perp \rightarrow \perp) = \top$, if $X \not\models \psi$, and $\phi^X = \perp$, otherwise

Son et al. 2022- **Answer Set Planning: A Survey**

<https://arxiv.org/abs/2202.05793>

Dimopoulos et al. 1997. **Encoding planning problems in nonmonotonic logic programs**. In *Proceedings of the Fourth European Conference on Planning*, Lecture Notes in Artificial Intelligence, vol. 1348. 169–181.

Dimopoulos et al. 2019. **plasp 3: Towards effective ASP planning**. *Theory and Practice of Logic Programming* 19, 3, 477–504.

- Planning problems can be encoded as declarative logic programs – each satisfying model contains a sequence of actions representing a valid plan.
- Non-monotonicity of ASP enables incremental re-planning: incorporating new facts discovered while stepping through the plan.

Planning with Large Language Models?

Evaluating LLM planning and reasoning capabilities

- Borji 2023 - **A Categorical Archive of ChatGPT Failures** [2302.03494]
- Valmeekam et al. - **Large Language Models Still Can't Plan** (A Benchmark for LLMs on Planning and Reasoning about Change) [2206.10498]
 - Correct plans: GPT-3 3/500 (0.6%) ; Instruct-GPT3: 25/500 (5%) ; BLOOM: 1/200 (0.5%)

Figure 2: The diagrammatic overview of the overall test framework. Broadly, our system consists of a domain-specific component that allows the generation of various instances of the specific PDDL planning problems and the **translation of the PDDL information to text and back**. The domain-independent component is responsible for generating the various specific test instances that will be

"LLMs can't plan very well", or can they?

Some success is being reported

■ Li et al. 2022 - **Pre-Trained Language Models for Interactive Decision-Making** [2202.01771]

- VirtualHome & BabyAI

- Improves combinatorial generalization: for out-of-distribution tasks involving new combinations of goals, states or objects, LM pre-training improves task completion rates by 43.6%

■ Pallagani et al. 2022 - **Plansformer: Generating Symbolic Plans using Transformers**

- Fine-tuned CodeT5 (a masked language model trained on code) for symbolic plan generation (PDDL for Blocksworld, Towers of Hanoi, Grippers, Driverlog).

- Towers of Hanoi: (97% valid plans, out of which 95% are shortest length plans) [NOTE: no Natural language in input or output]

■ Wang et al. (2023) **Describe, Explain, Plan and Select: Interactive Planning with Large Language Models Enables Open-World Multi-Task Agents**

- LLM as Explainer and Planner + RL trained goal Selector + goal conditioned low-level controller (RL or IL trained)

- can robustly accomplish 70+ Minecraft tasks
